Outbreak of 2019 Coronavirus Disease (COVID-19)
Travel Brief 12th June 2020

Latest updates (since June 5th)

**Situation report in the Caribbean region**
- 37,215 confirmed cases of COVID-19 in the Caribbean
  - 16,802 recovered
  - 988 deaths

**Updated impact on the cruise ship industry**
- One challenge faced by the cruising industry is that the majority of ships touch multiple nations on each itinerary. Each country will have its own set of rules and regulations to comply with.
- According to CLIA global chair, Adam Goldstein, it is premature to say where CLIA members might first relaunch but, it is likely 1/ there will be a sequencing of cruise resumption in different regions, 2/ cruises may be shorter toward the beginning, 3/ they could go to fewer ports at the beginning.

**Updated impact on the travel and tourism industry**
- On June 10, the WTTC updated their previsions of the impact of COVID-19 on the travel and tourism industry and experts came up with three possible outcomes for the sector
  - Worst-case scenario: restrictions starting to ease from September for short-haul and regional travel, from October for mid-haul and from November for long-haul.
    - **Impact:** 197.5 million jobs could be lost in the global Travel & Tourism sector, with a loss of $5,543 billion in global GDP. Global visitor numbers would drop by 73% for international arrivals.
  - Baseline scenario: Current restrictions starting to ease from June for regional travel, July for short-haul or regional travel; from August for mid-haul, and from September for long-haul.
    - **Impact:** 121.1 million jobs could be lost in the global Travel & Tourism sector, with a loss of $3,435 billion in global GDP. Global visitor numbers would drop by 53% for international arrivals and by 34% for domestic arrivals.
  - Best-case scenario: Current measures starting to ease from June for short-haul and regional travel; from July for mid-haul and from August for long-haul.
    - **Impact:** 98.2 million jobs could be lost in the Travel & Tourism sector, with a loss of $2,686 billion in global GDP. Global visitor numbers would drop by 41% for international arrivals and by 26% for domestic arrivals.
1. **Situation report**

**In the world**
An outbreak of Coronavirus Disease causing severe acute respiratory illness was reported in China since December 21, 2019. The virus has not been previously identified and so, since it is new, there is still little known about it including its origin.

As of 12, June 2020, there were 7,654,096 confirmed cases and 425,353 deaths. Whilst most cases are from China, the virus has now spread to over 120 countries. There is evidence of human to human transmission among cases both in and outside of Wuhan City, China and internationally. Human-to-human transmission has been confirmed largely in Wuhan city, but also some other places in China and internationally.

On March 11, the World Health Organization (WHO) declared a global pandemic as the coronavirus rapidly spreads across the world. The International Health Regulation Emergency Committee is not recommending trade or travel restrictions at this time. The US Center for Disease and Control (CDC) has issued travel advisories in countries where there is demonstrated sustained transmission.

**In the Caribbean region**
The first case of the disease in the English-Speaking Caribbean was reported in Jamaica on 10 March 2020. The risk of further importation of cases to the Caribbean remains **Very High**.

The Regional Coordinating Mechanism for Health Security (RCM-HS), is actively working with Heads of Government and regional partners on a collective approach to the COVID-19 response. **Countries are strongly urged to strengthen their health sector response and move to a state of readiness and rapid response.**

Health authorities in CARPHA Member States (CMS) must be ready to respond to possible importation of cases and subsequent local transmission. They are also encouraged to increase their capacity for surveillance and review their pandemic preparedness plans, as a matter of urgency.

**CARPHA: COVID-19 Travel Brief: Updated 12 June 2020.**
To date, there are 37,215 confirmed cases of COVID-19 in the Caribbean from 32 countries (Table, WHO).

| Anguilla**         | • China, Europe (including UK), Hong-Kong, Italy, Iran, Japan  
• March 20, 2020: Anguilla’s ports (sea and air) are closed for 14 days for all passenger movements. More information [here](#).  
• Ports will remain closed for the movement of all passengers until April 21, 2020. More information [here](#).  
• April 8, 2020: The Executive Council introduced a Regulation under the Emergency Powers Act prohibiting the use of any boat in Anguilla’s waters, other than those specifically exempted. This prohibition will come into force on April 8, 2020 until April 21, 2020. More information [here](#).  
• April 16, 2020: the notice and regulations prohibiting the use of any boat in Anguilla’s waters unless specifically exempted have been extended to 12 May. More information [here](#).  
• April 27, 2020: ports will remain closed for passenger movements until the situation outside Anguilla allows to reopen them safely. It is unlikely to be before the end of May. All establishments must close at 9.00 pm.  
• May 31, 2020: extension of the period for the closure of all ports in Anguilla to 30 June, 2020 from the current date of 31 May, 2020. | ✓  | ✓  |
| Antigua & Barbuda****  
* | • Canada, China, Europe, France, Germany, Italy, Iran, Japan, Singapore, South Korea, United States  
• March 26, 2020: the V.C. Bird International Airport will be closed to all incoming commercial flights. After this date, commercial airlines can fly an empty aircraft into Antigua for the sole purpose of collecting citizens of their respective countries.  
• March 26, 2020: all inbound commercial traffic from North America and Europe shall be denied entry into Antigua and Barbuda. More information [here](#).  
• March 27, 2020: all ports of entry on Barbuda will be closed for 14 days. The maritime border is consolidated on the island of Antigua: all international maritime arrivals must enter via Nevis Street Pier in St John’s. More information [here](#).  
• April 24, 2020: VC Bird International Airport may reopen by mid-June. More information [here](#).  
• May 22, 2020: opening of borders in a phased approach from June 1, 2020, when the V.C. Bird International Airport begins accepting international and regional traffic, [here](#).  
• June 2, 2020: reopening of borders to regional and international air traffic in a phased approach. More information [here](#). | ✓  | ✓  |
| Aruba**             | • China, EU, Great Britain, Hong-Kong, Italy, Iran, Macau, Norway, Japan, Singapore, South Korea, Switzerland, Taiwan  
• March 14, 2020: the Queen Beatrix International Airport elevated its control on flights arriving from other countries that do not fall under the travel restriction. More information [here](#).  
• March 17, 2020: at midnight through March 31, 2020, Aruba will restrict entry to Aruba to all travellers except for legal residents of Aruba. More information [here](#). | ✓  | ✓  |

<tr>
<td></td>
<td>May 17, 2020: The Bahamas are looking at a possible opening date for commercial travel on or before July 1 this year. Dates may change depending upon circumstances. On Sunday the Prime Minister also announced the introduction of a COVID-19 travel card which would allow for the resumption of inter-island travel. The process is scheduled to begin on Wednesday. Applicants are required to submit to an evaluation by a physician authorised by the Ministry of Health. This evaluation includes a risk assessment questionnaire to determine the individual’s level of risk for COVID-19, and a physical exam to determine the presence of any symptoms consistent with the virus. If deemed low-risk, and the physical exam does not reveal any symptoms it is expected that the person will be issued a COVID-19 Authorisation Travel Card that will allow travel to the Family Islands. If the individual is deemed higher risk or has symptoms that may be consistent with COVID-19, the individual will be referred for testing to definitively determine their COVID-19 status. The first phase of this initiative targets residents of Family Islands who have been stuck in the capital. They will now be allowed to return home.</td>

3. Impact on travel and tourism industry in the Caribbean

Context

The Caribbean region is known as the world’s most prominent travel destinations, famous for its tropical weather, crystal clear blue waters, white sand beaches and rich culture. These features make the region an attractive destination to foreigners, particularly those seeking to escape colder climates. The tourism industry is especially important for the Caribbean economy as it is one of the main sources of revenue. According to the World Travel and Tourism Council’s (WTTC) Tourism Satellite Account (WTTC 2001), tourism accounted for approximately 2.5 million jobs or 15.5% of total employment in 2001 and contributed 5.8% (US $9.2 billion) to region’s Gross Domestic Product (GDP).

Caribbean tourism is vulnerable to many external factors, health being one of them. Negative health publications against an island or unmanaged epidemics can seriously harm the inflow of tourists and tarnish the reputation of Caribbean tourism destinations. Without a market, the Caribbean economy suffers from a fall in tourism generated revenue. Additionally, high and increasing numbers of visitors to the Caribbean threatens the health, safety and security of both resident and visitor populations by contributing to disease spread. Due to its tropical climate, the region is mainly vulnerable to outbreaks associated with chikungunya, malaria, dengue, zika and measles. Adding to this list, we now must account for the possible spread of the 2019 Coronavirus Disease.

Reports of suspected cases in Europe and North America puts the Caribbean region on alert as 72% of visitor arrivals come from these regions. We must also note that the occurrence of this outbreak coincides with the peak of Carnival activities in the region, which usually sees approximately 42% increase in visitor arrivals for this period.

Impact on the air transport industry

The outbreak of COVID-19 has major consequences on global air traffic and the Caribbean region is no exception. International travel restrictions and the full or partial closure of businesses and industries in Asia, Europe, and North America have led to a collapse in global travel and are expected to reduce the flows of remittances.

As of January 31st, according to the International Air Transport Association (IATA), domestic and international air travel demand decreased by 40% from 2019 to 2020. Their report indicates that “passenger volumes declined sharply following the closure of Wuhan airport and WHO’s declaration of the COVID-19 as an international public health emergency” (IATA, 2020). At the time, at least 70 airlines had cancelled or cut their flights to China until as late as March either upon government restrictions or due to a lack of passenger demand. 50 more had significantly reduced operations (Uniting Aviation, 2020).

This has resulted in an 80% reduction of foreign airline capacity for travelers directly to/from China, and a 40% capacity reduction by Chinese airlines. European and US airlines largely make up the list of airlines that have canceled flights. It represents more than 25 000 flights collectively. Beijing and Shanghai are some of the most affected cities (Business Insider, 2020). The companies that are not reducing service to China make up for it by offering travel waivers for customers to change or cancel flights without a fee.
On February 21, the International Air Transport Association (IATA) estimated that due to the outbreak, airlines could lose around US$29.3bn of revenue this year (BBC News, 2020).

On March 5, their forecast was almost four times this estimate with projections that airlines could lose up to US$113bn because of the COVID-19 crisis (The Guardian, 2020). They predicted that the demand for air travel would fall for the first time in more than a decade.

According to UNTWO’s Report on COVID-19 related travel restrictions, as of April 6, 2020, around 96% of all worldwide destinations have introduced travel restrictions in response to the pandemic. About 43% (90 destinations) have completely or partially closed their borders. About 21% (44 destinations) have introduced travel bans to passengers coming from certain destinations that have been affected by COVID-19. About 27% (56 destinations) have suspended all or partially international flights into the destination.

On April 14, IATA released an updated analysis showing that the COVID-19 crisis will see airline passenger revenues drop by $314 billion in 2020, a 55% decline compared to 2019. Full-year passenger demand (domestic and international) is expected to be down 48% compared to 2019 (COVID-19 Puts Over Half of 2020 Passenger Revenues at Risk, s. d.). The two main elements driving this are:

- **Overall Economic Developments**: The world is heading for recession. The economic shock of the COVID-19 crisis is expected to be at its most severe in Q2 when GDP is expected to shrink by 6% (by comparison, GDP shrank by 2% at the height of the Global Financial Crisis). Passenger demand closely follows GDP progression. The impact of reduced economic activity in Q2 alone would result in an 8% fall in passenger demand in the third quarter.

- **Travel Restrictions**: Travel restrictions will deepen the impact of recession on demand for travel. The most severe impact is expected to be in Q2. As of early April, the number of flights globally was down 80% compared to 2019 in large part owing to severe travel restrictions imposed by governments to fight the spread of the virus. Domestic markets could still see the start of an upturn in demand beginning in the third quarter in a first stage of lifting travel restrictions. International markets, however, will be slower to resume as it appears likely that governments will retain these travel restrictions longer.

On April 15, 2020, Emirates Airline became the first airline to roll out rapid on-site testing of COVID-19. The analysis is a blood test with results within 10 minutes. The testing began with passengers on a flight from Dubai to Tunisia on Wednesday. Emirates says it is working to scale up testing capabilities and extend it to other flights. It says its testing could also be used to provide confirmation for Emirates passengers traveling to countries that require COVID-19 test certificates (Emirates Airline Begins Conducting Rapid COVID-19 Tests For Boarding Passengers, 2020).
In the Caribbean region, the Airline LIAT has stated that the islands they operate in and out of have restricted travel to persons who have visited or resided in the following countries: People’s Republic of China, Hong Kong, Singapore, Japan, South Korea, Macau.

As cases of COVID-19 continue to spread all over the world, on March 2nd, Caribbean Airlines (CAL) announced it is putting measures in place to ensure their readiness in case of any eventualities and although none of their destinations have travel bans imposed. Measures include placing special safety kits on board all aircraft and at offices, monitoring the air quality in its aircraft cabins, continuing to ensure compliance with aircraft cleaning procedures, ensuring that all aircraft are properly sanitized at all ports, equipping employees with international guidelines on how to deal with any suspected cases of COVID-19, activating a special response team to monitor the situation in real time and promoting frequent handwashing practices amongst its crew members and passengers. They are also putting contingencies in place in the event of any future disruptions. CAL is permitting travelers on Caribbean Airlines with onward connections to or from mainland China, Iran, Italy, Japan, South Korea and Singapore to rebook the Caribbean Airlines travel segment without change fees, subject to conditions (Loop News, 2020a).

On April 19, 2020, due to the current worldwide health situation, regional airline LIAT has announced a further postponement of air travel until, at least, May 15. Several destinations have extended border closures and instituted strict travel restrictions, which means that passengers are unable to travel. The airline is however expected to still operate its cargo flights to several destinations. Passengers who had booked flights during the period of suspension that they would automatically have their bookings cancelled and receive a full credit (SKNVibes | LIAT announces further suspension, s. d.).

What may the post COVID-19 period look like for the air transport industry?

Airlines have begun to look at what it will take to get fliers back on planes in a post-pandemic world.

Some measures considered include:

1. Blocking middle seats in the name of social distancing and deep sanitizing of plane cabins will likely be sticking around for the foreseeable future, but another possible preventative step has surfaced in the industry: immunity passports for COVID-19.

2. An immunity passport is essentially a document issued to anyone who has recovered from COVID-19, and therefore whose immune systems would theoretically have the antibodies necessary to fight off the virus and prevent a second infection. States like New York have begun testing citizens for antibodies. At least one nation, Chile, has already begun to issue COVID-19 immunity passports to people who have recovered from the virus. Other countries, including Italy, Germany, and the U.K., are seriously examining the idea of issuing immunity cards. There are also reports that U.S. officials could be open to the idea of immunity documentation. Medical researchers, however, do not have definitive evidence that the presence of antibodies guarantee immunity from COVID-19. "About 2 percent of
patients who had recovered from the virus in South Korea, for example, were forced to return to isolation after contracting COVID-19 for a second time, the World Health Organization told Reuters. Other critics say the cards could lead to job discrimination, a black market for immunity passports, or people intentionally trying to become infected with the coronavirus in order to recover and be allowed return to work.

3. In lieu of immunity passports, some airlines like Emirates have begun administering rapid result blood tests for the coronavirus before boarding on certain repatriation flights. If a passenger tests positive for COVID-19, they are not allowed to board (Puckett, 2020).

Impact on the cruise ship industry

The cruise ship industry generates more than $150 billion per year in global economic activity and supports over 1.17 million jobs worldwide. Cruising also touches almost every sector, from transportation to agriculture, to hospitality and tourism, manufacturing and beyond (Update On Cruise Industry Response To COVID-19, 2020).

Several cruise ship companies expect global booking to be affected by the media coverage around the multiple cruise ships stranded at sea and non-stop attention to the coronavirus outbreak. However, it is still early to quantify it at the bottom line. According to the Signature Travel Network, a cooperative of travel agencies with more than 7 000 advisers, the demand for cruises was down by 10 to 15 percent year-over-year so far in February (Washington Post, 2020). On top of the economic hit that the $45bn industry may suffer from, the COVID-19 outbreak may affect customer confidence towards cruises for a long time (New York Times, 2020).

The CDC recommends that “all travelers reconsider cruise ship voyages to or within Asia” (CDC, 2020). They also note that “older adults and travelers with underlying health issues should avoid situations that put them at increased risk for more severe disease. This entails avoiding crowded places, avoiding non-essential travel such as long plane trips, and especially avoiding embarking on cruise ships.”

Effective March 14th, the CDC issued a No Sail Order for cruise ships. CDC commends the Cruise Lines International Association (CLIA), the leading industry trade group, for their willingness to voluntarily suspend cruise ship operations from U.S. ports of call beginning on March 13, 2020 for the next thirty (30) days (Cruise Ship Guidance | Quarantine | CDC, 2020).

On March 13th, in light of mounting fears over onboard Covid-19 outbreaks, CLIA made the decision to suspend operations as requested by the CDC. The same day, all three major publicly traded cruise companies had suspended at least some operations over the COVID-19 pandemic.

- Norwegian Cruises announced the immediate suspension of global operations until April 11.
- Carnival’s Princess Cruises is suspending global operations until May 10.

Shares of all three companies have fallen over 60% since Jan. 1 (CNBC, 2020).

On March 15th, several cruise ships were stranded at sea, some with confirmed coronavirus cases on board. Some ships have been denied port, leaving them to anchor off the coast of a country. Other cruises have docked with quarantined passengers aboard. Three cruise ships for example have had confirmed cases of coronavirus on board: the MS Braemar, Silver Shadow and Silver Explorer. MS Braemar that had at least five confirmed coronavirus cases (four passengers and one crew member) spent days searching for a place to dock after it was refused several ports of entry in the Caribbean. It is now anchored about 25 miles offshore in the Bahamas, being resupplied with food, fuel and medication. Cuba has said it will receive the ship and “comprehends the difficult situation these passengers find themselves in” (CNN, 2020a).

On April 1, more than a dozen cruise ships remain stranded at sea right now -- some with and some without passengers -- as ports deny entry and passengers panic about returning home. The Industry group CLIA encompasses 38 cruise companies, with a total of 277 ships. The organization confirmed to CNN on March 31 that 3.6% of the total fleet was still at sea completing adjusted itineraries and five ships are awaiting debarkation. CLIA is now “asking ports and governments around the world to allow these ships to come into port so that those onboard can make their way home safely and as quickly as possible.” Major cruise lines P&O, Cunard, Carnival, Royal Caribbean and Holland America have now extended their ban on cruising until mid-May (CNN, 2020b).

On April 9, CDC renewed the No Sail Order and Other Measures Related to Operations Order signed by the CDC Director on March 14, 2020. This Order shall continue in operation until the earliest of (1) the expiration of the Secretary of Health and Human Services’ declaration that COVID-19 constitutes a public health emergency; (2) the CDC Director rescinds or modifies the order based on specific public health or other considerations; or (3) 100 days from the date of publication in the Federal Register (Cruise Ship Guidance | Quarantine | CDC, 2020). The new order means that, at the very soonest, cruise lines aren’t likely to be sailing before mid-July (Forbes, 2020).

On April 10, CLIA expressed their concern about the unintended consequences the No Sail Order issued has in singling out the cruise industry which has been proactive in its escalation of health and sanitation protocols and was one of the first industries to announce a voluntary suspension of operations (CLIA Statement Regarding No Sail Order Issued by the U.S. Centers for Disease Control and Prevention (CDC) on April 9, 2020, s. d.). Cruise activity supports multiple sectors of the U.S. economy (transportation, food and beverage, lodging, manufacturing, agriculture, travel agencies and travel agents, plus a broad range of supply chain industries and small businesses) that stretch across the United States. Should the suspension of sailing extend well beyond the appropriate time to resume business, the economic impact could be significant given each day of the suspension results in a total economic impact loss of about $92 million and the loss of more than 300 direct and 620 total American jobs. Over time the pace of the losses will increase and could result in a total economic impact loss to

the United States of $51 billion and 173,000 direct and 343,000 total American jobs if the Order were to remain in effect for a year (Source: BREA/CLIA Economic Impact Analysis).

On April 21, the last cruise ship carrying passengers finally docked on April 22nd in Italy. It will be another three months at least, until cruise ships will once again be able to sail from U.S. ports. In the meantime, cruise lines are dealing with a host of lawsuits filed by passengers and crew who accuse the companies of negligence in exposing them to the COVID-19 disease (Aronfeld, 2020).

The Union Bank of Switzerland (UBS) forecast that during the first half of 2021, roughly 50% of cruise fleets will be in service, going to 75% in the second half of the year with pricing down 4-8% from 2019. By 2022, UBS estimates revenue will be about 10% below 2019 levels for Carnival Corp. and Norwegian Cruise Line Holdings and flat for Royal Caribbean Cruises Ltd., whose fleet is expected to come back slightly faster (UBS Analyst Says 2020 Will Be Virtual Washout for Cruise Lines, 2020).

On May 5, the third largest cruise operator in the world, Norwegian Cruise Line announced that it might soon be out of business as a result of the COVID-19 pandemic. In a filing submitted to the United States Securities Exchange Commission, the company said its accounting firm has substantial doubt about its ability to resume operations after the pandemic. The announcement sparked concern in the British Virgin Islands, about its inevitable impact on the territory’s economy. According to BVI Port Authority records, the Norwegian made over 30 scheduled calls to the territory in 2019. This amounted to approximately $18 million in revenue from the Norwegian Cruise Line last year (Loop News, 2020b).

On June 9, the suspension of Cunard cruises, which are part of the Carnival Group, has been extended until the end of July (BBC News, 2020).

How is the cruise ship industry preparing for the post COVID-19 period?

In the midst of the coronavirus crises, cruise companies embark on a raft of improvements to save their reputations. It could change the face of cruising as we know it. Strict medical protocols have already been implemented when a series of major cruise lines went into lockdown following outbreaks onboard. While UBS predicts that cruise operations will resume by 2021, the demand is already there. Reservations for next year are up to 40% from 2019 as holidaymakers rally to reschedule canceled trips and new customers plan ahead (Gilchrist, 2020).

Some of the changes considered include:

1. Enhanced health care measures: more stringent boarding procedures, better monitoring capabilities and quarantine arrangements, regular temperature checks, expanded onboard medical centers, improved air filtration systems and mandatory “fit to travel” documents for older travelers could all become part of the package for future cruises.

2. Self-service buffet could soon be a thing of the past — replaced by crew-manned serving stations and table service. Reservation systems, too, could become routine for both dining rooms and entertainment venues, as liners move to comply with stricter capacity limits.

3. The use of technologies to increase the tourism industry’s level of safety such as sterilization robots already used in other parts of the tourism industry and that could ensure hospital-level sanitation standards.

The COVID-19 crisis could also spell new demand for smaller operators such as expeditions and river cruises. The pandemic could accelerate a wider industry shift toward “more considered” smaller-scale travel (Gilchrist, 2020).

One of the challenges faced by the cruising industry is that the majority of ships touch multiple nations on each itinerary. Each country will have its own set of rules and regulations to comply with. According to CLIA global chair, Adam Goldstein, this is not new for cruising as "there’s never been a perfect harmony across the 1,000 destinations that cruise ships visit, and somehow we managed to work out a fairly seamless vacation environment". CLIA CEO Kelly Craighead said that regulatory agencies worldwide have approached the cruise industry in different ways. Given those complexities, Goldstein said it is premature to say where CLIA members might first relaunch. He said that it is likely there will be a sequencing of cruise resumption in different regions. He expects that cruises may be shorter toward the beginning; they could go to fewer ports at the beginning. It will take time, and there will be an evolution back towards what they were doing pre-pause. (Jainchill, 2020)

What it means for the travel and tourism industry in the world and in the Caribbean
The tourism sector is currently one of the hardest-hit by the outbreak of COVID-19, with impacts on both travel supply and demand. This represents an added downside risk in the context of a weaker world economy, geopolitical, social and trade tensions, as well as uneven performance among major outbound travel markets.

Considering the evolving nature of the situation, it is too early to estimate the full impact of the COVID-19 on international tourism. For its initial assessment, UNWTO takes the SARS scenario of 2003 as a benchmark, factoring in the size and dynamics of global travel and current disruptions, the geographic spread of COVID-19 and its potential economic impact.

On March 21, highlighting the issue’s importance, the head of the World Tourism Forum Institute said that with the sectors related to tourism, the total economic losses might go as high as $5 trillion (Anadolu Agency, 2020). The World Travel and Tourism Outlook has also indicated that up to 50 million jobs could be lost globally because of the pandemic. Once the outbreak is over, it could take up to 10 months for the industry to recover. Of the 50 million jobs that could be lost, around 30 million would be in Asia, seven million in Europe, five million in the Americas and the rest in other continents. (World Economic Forum, 2020)

On March 27, based on the latest developments (quarantine measures, travel bans & border closures in most of Europe, which represents 50% of international tourism, and in many countries of the Americas, Africa and the Middle East), the evolutions in Asia and the Pacific and the patterns of previous crises (2003 SARS and 2009

19
global economic crisis), UNWTO estimates that international tourist arrivals could decline by 20% to 30% in 2020, down from an estimated growth of 3% to 4% forecast in early January 2020.

This could lead to (UNWTO, 2020):

- **290 to 440 million** International Tourist Arrivals
- **5 to 7 years** lost in number of tourists
- **300 to 450 US$ bn** Tourism Exports (receipts), almost one third of the US$ 1.5 trillion generated globally in the worst-case scenario.
- **1/3 of 1.5 US$ trillion** lost in Tourism Exports

On June 10, the WTTC updated their previsions of the impact of COVID-19 on the travel and tourism industry and experts came up with three possible outcomes for the sector. (WTTC, 2020b)

1. **Worst-case scenario:** Current restrictions starting to ease from September for short-haul and regional travel, from October for mid-haul and from November for long-haul.

   In this scenario, 197.5 million jobs could be lost in the global Travel & Tourism sector, with a loss of $5,543 billion in global GDP. Meanwhile, global visitor numbers would drop by 73% for international arrivals.

2. **Baseline scenario:** Current restrictions starting to ease from June for regional travel, July for short-haul or regional travel; from August for mid-haul, and from September for long-haul.

   In this scenario, a total of 121.1 million jobs could be lost in the global Travel & Tourism sector, with a loss of $3,435 billion in global GDP. Meanwhile, global visitor numbers would drop by 53% for international arrivals and by 34% for domestic arrivals.

3. **Best-case scenario:** Current measures starting to ease from June for short-haul and regional travel; from July for mid-haul and from August for long-haul.

   In this scenario, a total of 98.2 million jobs could be lost in the Travel & Tourism sector, half the number in the worst-case scenario, with a loss of $2,686 billion in global GDP. Meanwhile, global visitor numbers would drop by 41% for international arrivals and by 26% for domestic arrivals.

   While the best-case scenario would undoubtedly still result in a devastating blow for Travel & Tourism, this outcome avoids unnecessary additional harm to the sector as a result of prolonged travel restrictions and protects almost 100 million jobs around the world that could otherwise be lost. This best-case scenario can still be achieved for the global Travel & Tourism sector if Governments around the globe follow WTTC’s recommended four-point plan.

   In the Caribbean region, the COVID-19 outbreak could have considerable implications for citizens and their economies. The authors of the Caribbean Development Trends paper say that the magnitude of this impact will depend crucially on the spread of the virus, the duration of the outbreak, and measures countries in the region and elsewhere undertake to insulate themselves. It will also have much to do with country economic

structures—particularly tourism dependence if the global crisis extends into the 2020-21 winter high season for tourism.

Given that tourism employs 2.4 million people in the Caribbean region and contributes more than $62 billion (15.5 percent) to GDP (2018) as the most tourism-reliant region in the world, the Caribbean region cannot afford the staggering losses that are being felt across the global tourism industry as a result of the virus.

The coronavirus crisis is already affecting the region through several channels:

- **Temporary suspension of hotels operations**
  - **Jamaica**: Tourism Minister Edmund Bartlett admitted that the entire tourism industry in Jamaica is facing imminent closure given the travel restrictions on many of its source markets as well as local containment and restriction protocols (Jamaica Observer, 2020)
    - RIU announced that it was closing three of its properties: RIU Palace, RIU Negril and RIU Montego Bay, as of March 19 through April. Some 1,000 workers are expected to be left without jobs during the period of closure (Caribbean News, 2020)
    - Sandals Resorts International is closing all 19 Sandals and Beaches Resorts from March 30 to May 15; no new arrivals will be accepted as of March 23. The brand is responsible for thousands of jobs, particularly on Jamaica’s north coast. The temporary closure of these and other hotels means that thousands of hospitality workers will possibly be without an income (Caribbean News, 2020)
  - **The Bahamas**
    - Club Med is shuttering the Club Med Columbus Isle between March 21 and May 1 (Travel Weekly, 2020)
  - **Sint Maarten**
    - The Sonesta Ocean Point Resort and Sonesta Maho Beach Resort will close from March 22 to March 31 due to government-imposed restrictions on travel to the destination (Travel Weekly, 2020)
  - **Dominican Republic**
    - Club Med will suspend operations at its Club Med Punta Cana and Club Med Miches Playa Esmeralda resorts from March 19 to May 1
    - Excellence Resorts will temporarily close the Excellence Punta Cana from March 20 to June 5 (Travel Weekly, 2020)

- **A lower demand for tourism services**
  - According to the international Monetary Fund, in the Caribbean, lower tourism demand due to travel restrictions and “the fear factor”—even after the outbreak recedes—will weigh heavily on economic activity. Commodity exporters will also be strongly impacted and a reduction in remittances is likely to add to the economic strain (International Monetary Fund Blog, 2020)
o St Lucia’s Prime Minister, Allen Chastenet recently said that his government is modelling various COVID-19 impact scenarios including a potential fall in arrivals of between 50 to 80%.

o The Economic Commission for Latin America and the Caribbean calculated that if a travel ban prompted by the virus were to last for one, two, or three months, tourism activity in the Caribbean, for example, would contract by 8%, 17% or 25%, respectively, in 2020 (Economic Commission for Latin America and the Caribbean, 2020)

- A rise in unemployment and poverty

  o The Economic Commission for Latin America and the Caribbean, is estimating a contraction of -1.8% in regional Gross Domestic Product (GDP), which could lead to unemployment in the region rising by 10 percentage points. This could lead to the number of poor in the region rising from 185 million to 220 million people, out of 620 million inhabitants in total; and the quantity of people living in extreme poverty could increase from 67.4 million to 90 million. (Economic Commission for Latin America and the Caribbean, 2020)

Anton Edmunds, Saint Lucia’s ambassador to the United States and permanent representative to the Organization of American States stated that “beyond hotel owners and operators, the impact of the pandemic extends to suppliers, farmers and ground-based transportation providers—that is, small businesses and entrepreneurs. There is probably nowhere within the regional economy where the impact will not be felt. So-called middle-income Caribbean countries, among the most highly indebted nations in the world, are at real risk of recession” (The Dialogue, 2020).

On April 30, 2020, according to CTO, in 2020, the Caribbean region registered an estimated 15.4% reduction in level of arrivals in the first quarter when compared to 2019. The estimated reduction in arrivals for March 2020 when compared to 2019 is 39.7%. By the ending of March 28, 2020, hotel occupancy had been estimated by Smith Travel Research – based on its reporting hotels – to have reached 10.6%. In the first quarter of 2020, cruise visits were reduced by an estimated 19.1% when compared to 2019. The month of March 2020 showed an estimated 57.4% reduction in visits, in a similar vein to stayover arrivals. A preliminary projection for 2020 of a minimum 50% reduction in regional stayover arrivals would take the Caribbean back to 1995/1996 levels, a reversal of 25 years of growth. While revenues from tourism are not in a linear relationship to arrivals, we can extrapolate that a significant reduction in tourism activity will lead to a significant reduction in tourism receipts.

The potential for COVID-19 to result in reduction in real GDP in Caribbean countries across the board is between 15 and 30%. Similarly, the potential for the increase in public debt is between 15 and 60%.

As the pandemic has unfolded in the Caribbean and governments and planners grapple with its effects, it has been recognized that the Caribbean, like the rest of world, will be dealing with a “new normal” post COVID. This “new normal” will see greater integration of public health and tourism.

CTHA completed a member survey which queried the industry on a number of matters to gauge impact and outlook. The results were shared on May 5, 2020:

• 69% of Caribbean hotels presently closed look to reopen between now and the end of July assuming borders are open.

• Intra-Caribbean Business and Leisure Travel is expected to return first, followed by land-based travel from the U.S. and Canada, then from Europe. Cruise travel’s return expected to take at least 10 months.

• Recovery expected to be gradual, with 28% expressing confidence in a tourism turnaround beginning by the end of 2020 but most anticipating the beginning of a significant turnaround to take longer, into the first half of 2021. Note: other data is indicating that hotel occupancy next winter/spring will still likely be running under 50 percent during the traditional peak season.

• Nearly 2/3rds of employers reported in April being able to provide some measure of salary support for employees, most citing it difficult to do so even on partial basis beyond two months.

• Hotels peg break-even occupancy level at 52% with austerity measures in place. Summer and fall occupancies are expected to be in the 10% to 40% range with most likely hovering on the lower end.

• 43% of Covid-19 induced cancellations expected to rebook. Most hotels honored a no-penalty rebooking window of 12 months.

• 69% of hotels report not receiving reimbursements from some tour operators for services rendered in first quarter.

• Average amount outstanding by those tour operators delaying reimbursements is $219,000 with highest reported outstanding amount owned to one property at $15 million.

• 68% report not having business interruption insurance, with the overwhelming percentage who do have it indicating it does not cover pandemics.

On May 27, the World Travel and Tourism Council announced they would launch a stamp called “Safe Travels”. The specially designed stamp will allow travellers to recognise governments and businesses around the world which have adopted health and hygiene global standardised protocols (WTTC, 2020a). Eligible businesses such as hotels, restaurants, airlines, cruise lines, tour operators, restaurants, outdoor shopping, transportation and airports, will be able to use the stamp once the health and hygiene protocols.

In the Caribbean region, countries are preparing for the reopening of tourism. Aruba, whose Tourism sector accounts for 98% of the Gross Domestic Product (The Institute of Banking and Finance of Trinidad and Tobago, 2020), plans to open its doors to travel between June 15 and July 1 (Hardingham-Gill, 2020). Tourists will be subject to temperature checks on arrivals and the department of Public Health introduced the “Aruba Health & Happiness Code”, a cleaning and hygiene certification program for all business in the industry (Visit Aruba, 2020).

Saint-Lucia, as well, prepares for the reopening of tourism from June 4. Tourists will have to show a certified proof of a negative Covid-19 test taken within 48 hours of boarding their flight and will be subject to temperature screenings. They will also be required to wear face masks and practice social distancing during they stay. New

safety measures for taxis will be implemented to separate drivers and passengers. Hotels must also have appropriate cleaning measures and social distancing measures in place. Criteria for sanitization, social distancing and other COVID-19 protocols are being developed and must be met before they will be permitted to open to guests (St. Lucia Tourism Authority, 2020).

Advise to Travelers Visiting the Caribbean
Avoid nonessential travel to countries with local / community transmission. If you must travel:

- Avoid contact with sick people.
- Discuss travel to China with your healthcare provider. Older adults and travellers with underlying health issues may be at risk for more severe disease.
- Avoid animals (alive or dead), animal markets, and products that come from animals (such as uncooked meat).
- Wash hands often with soap and water for at least 20 seconds. Use an alcohol-based hand sanitizer if soap and water are not available.
- Maintain at least 1 metre (3 feet) distance between yourself and anyone who is coughing or sneezing.

If you were in China in the last 14 days and feel sick with fever, cough, or difficulty breathing, you should:

- Seek medical care right away. Before you go to a doctor’s office or emergency room, call ahead and tell them about your recent travel and your symptoms.
- Avoid contact with others.
- Not travel while sick.
- Cover your mouth and nose with a tissue or your sleeve (not your hands) when coughing or sneezing.
- Wash hands often with soap and water for at least 20 seconds. Use an alcohol-based hand sanitizer if soap and water are not available.
In this context, the Regional Tourism and Health Program (THP) is an innovative program that aims to enhance the health and well-being of visitors and locals and thereby improve the quality, competitiveness, reputation and resilience of Caribbean tourism. It is being executed by the Caribbean Public Health Agency (CARPHA), the Caribbean’s sole public health agency responsible for preventing disease, promoting and protecting health, in collaboration with CTO, CHTA and countries. The aim is to strengthen countries’ capacities to provide cost-effective, quality solutions to health, safety and environmental sanitation (HSE) threats to tourism. To protect themselves, visitors are encouraged to self-report (www.this.carpha.org) to capture illnesses in real time from stay over travelers and trigger a rapid and coordinated response, so as to reduce illness spread, economic and reputational negative impact.

CARPHA will continue to monitor the situation and provide regular updates via email, on their website and social media. Teleconferences will be scheduled as necessary. The latest media release is available from CARPHA’s web.
4. Appendices

WHO Case Definitions for Surveillance of COVID-19

Suspect case
A. A patient with acute respiratory illness (fever and at least one sign/symptom of respiratory disease (e.g., cough, shortness of breath), AND with no other aetiology that fully explains the clinical presentation AND a history of travel to or residence in a country/area or territory reporting local transmission (See situation report) of COVID-19 disease during the 14 days prior to symptom onset.

OR
B. A patient with any acute respiratory illness AND having been in contact with a confirmed or probable COVID-19 case (see definition of contact) in the last 14 days prior to onset of symptoms.

OR
C. A patient with severe acute respiratory infection (fever and at least one sign/symptom of respiratory disease (e.g., cough, shortness breath) AND requiring hospitalization AND with no other etiology that fully explains the clinical presentation.

Probable case
A suspect case for whom testing for COVID-19 is inconclusive.

Confirmed case
A person with laboratory confirmation of COVID-19 infection, irrespective of clinical signs and symptoms.

WHO Advice on Travel
As of 29th February 2020, WHO continues to advise against the application of travel or trade restrictions to countries experiencing COVID-19 outbreaks.

In general, evidence shows that restricting the movement of people and goods during public health emergencies is ineffective in most situations and may divert resources from other interventions. Furthermore, restrictions may interrupt needed aid and technical support, may disrupt businesses, and may have negative social and economic effects on the affected countries. However, in certain circumstances, measures that restrict the movement of people may prove temporarily useful, such as in settings with few international connections and limited response capacities.

Travel measures that significantly interfere with international traffic may only be justified at the beginning of an outbreak, as they may allow countries to gain time, even if only a few days, to rapidly implement effective...
preparedness measures. Such restrictions must be based on a careful risk assessment, be proportionate to the public health risk, be short in duration, and be reconsidered regularly as the situation evolves.

Travel bans to affected areas or denial of entry to passengers coming from affected areas are usually not effective in preventing the importation of cases but may have a significant economic and social impact. Since WHO declaration of a public health emergency of international concern in relation to COVID-19, and as of 27 February, 38 countries have reported to WHO additional health measures that significantly interfere with international traffic in relation to travel to and from China or other countries, ranging from denial of entry of passengers, visa restrictions or quarantine for returning travelers. Several countries that denied entry of travelers or who have suspended the flights to and from affected countries, are now reporting cases

More information can be found here:

https://www.who.int/ith/2019-nCoV_advice_for_international_traffic-rev/en/

As of 11th February 2020, WHO has advised that countries should be prepared for containment, including active surveillance, early detection, isolation and case management, contact tracing and prevention of onward spread of COVID-19 infection, and to share full data with WHO. In accordance with their obligations under the Article 43 of the International Health Regulations (2005), States Parties must inform WHO about additional health measures that significantly interfere with international traffic.

https://www.who.int/ith/Repatriation_Quarantine_nCoV-key-considerations_HQ-final11Feb.pdf?ua=1

As of 27th January 2020, WHO advises that “that measures to limit the risk of exportation or importation of the disease should be implemented, without unnecessary restrictions of international traffic.” Countries should provide to traveller’s information to reduce the general risk of acute respiratory infections, via health practitioners, travel health clinics, travel agencies, conveyance operators and at Points of Entry. Several technical guides to aid in prevention and control of COVID-19 are readily available on the WHO website. https://www.who.int/emergencies/diseases/novel-coronavirus-2019/technical-guidance

Released Guidelines on how to screen travelers but also advises against the application of any restrictions of international traffic based on the information currently available on this event.

Advice for exit screening in countries or areas with ongoing transmission of COVID-19 (currently People’s Republic of China)

- Conduct exit screening at international airports and ports in the affected areas, with the aims early detection of symptomatic travelers for further evaluation and treatment, and thus prevent exportation of the disease. while minimizing interference with international traffic.

- Exit screening includes checking for signs and symptoms (fever above 38°, cough), interview of passengers with respiratory infection symptoms leaving the affected areas with regards to potential exposure to high-risk contacts or to the presumed animal source, directing symptomatic travelers to further medical examination, followed by testing for COVID-19, and keeping confirmed cases under isolation and treatment;

• Encourage screening at domestic airports, railway stations, and long-distance bus stations as necessary.

• Travelers who had contact with confirmed cases or direct exposure to potential source of infection should be placed under medical observation. High-risk contacts should avoid travel for the duration of the incubation period (up to 14 days).

• Implement health information campaigns at Points of Entry to raise awareness of reducing the general risk of acute respiratory infections and the measures required, should a traveler develop signs and symptoms suggestive of infection with the COVID-19 and how they can obtain assistance.

Advice for entry screening in countries/areas without transmission of COVID-19 that choose to perform entry screening

• The evidence from the past outbreaks shows that effectiveness of entry screening is uncertain, but it may support risk communication strategy by providing information to travelers from affected countries/areas to reduce the general risk of acute respiratory infections, and to seek medical attention early if they develop symptoms compatible with the infection.

• During the current outbreak with the Coronavirus Disease COVID-19, a number of exported cases were detected through entry screening implemented by some countries. Symptomatic cases may be detected through temperature screening at Point of Entry, for whom medical examination and laboratory tests will be conducted for confirmation. Temperature screening to detect potential suspect cases at Point of Entry may miss travelers incubating the disease or travelers concealing fever during travel and may require substantial investments. A focused approach targeting direct flights from affected areas could be more effective and less resource demanding.

• Currently the northern hemisphere (and China) is in the midst of the winter season when Influenza and other respiratory infections are prevalent. When deciding implementation of entry screening, countries need to take into consideration that travelers with signs and symptoms suggestive of respiratory infection may result from respiratory diseases other than COVID-19, and that their follow-up may impose an additional burden on the health system. National policy and capacities should be taken into account during the decision-making process.

• If entry screening is implemented, temperature screening should always be accompanied by dissemination of risk communication messages at Points of Entry. This can be done through posters, leaflets, electronic bulletin, etc., aiming at raising awareness among travelers about signs and symptoms of the disease, and encouragement of health care seeking behavior, including when to seek medical care, and report of their travel history.

• Countries implementing temperature screening are encouraged to establish proper mechanism for data collection and analysis, e.g. numbers of travelers screened and confirmed cases out of screened passengers, and method of screening.
• Public health authorities should reinforce collaboration with airline operators for case management on board an aircraft and reporting, should a traveler with respiratory disease symptoms is detected, in accordance with the IATA guidance for cabin crew to manage suspected communicable disease on board an aircraft.

https://www.who.int/ith/COVID-19_advice_for_international_traffic/en/

**WHO Advice on the use of masks**

As of April 6, 2020, WHO provided advice on the use of masks in communities, during home care, and in health care settings in areas that have reported cases of COVID-19.

Wearing a medical mask is one of the prevention measures that can limit the spread of certain respiratory viral diseases, including COVID-19. However, the use of a mask alone is insufficient to provide an adequate level of protection, and other measures should also be adopted. Whether or not masks are used, maximum compliance with hand hygiene and other infection prevention and control measures is critical to prevent human-to-human transmission of COVID-19.

**Community settings**

There is limited evidence that wearing a medical mask by healthy individuals in the households or among contacts of a sick patient, or among attendees of mass gatherings may be beneficial as a preventive measure. However, there is currently no evidence that wearing a mask (whether medical or other types) by healthy persons in the wider community setting, including universal community masking, can prevent them from infection with respiratory viruses, including COVID-19.

**Medical masks should be reserved for health care workers.** The use of medical masks in the community may create a false sense of security, with neglect of other essential measures, such as hand hygiene practices and physical distancing, and may lead to touching the face under the masks and under the eyes, result in unnecessary costs, and take masks away from those in health care who need them most, especially when masks are in short supply.

**Persons with symptoms should:**

- wear a medical mask, self-isolate, and seek medical advice as soon as they start to feel unwell. Symptoms can include fever, fatigue, cough, sore throat, and difficulty breathing. It is important to note that early symptoms for some people infected with COVID-19 may be very mild;
- follow instructions on how to put on, take off, and dispose of medical masks;
- follow all additional preventive measures, in particular, hand hygiene and maintaining physical distance from other persons.

**All persons should:**

- avoid groups of people and enclosed, crowded spaces;

• maintain physical distance of at least 1 m from other persons, in particular from those with respiratory symptoms (e.g., coughing, sneezing);
• perform hand hygiene frequently, using an alcohol-based hand rub if hands are not visibly dirty or soap and water when hands are visibly dirty;
• cover their nose and mouth with a bent elbow or paper tissue when coughing or sneezing, dispose of the tissue immediately after use, and perform hand hygiene;
• refrain from touching their mouth, nose, and eyes.

**Type of Mask.** WHO stresses that it is critical that medical masks and respirators be prioritized for health care workers. The use of masks made of other materials (e.g., cotton fabric), also known as nonmedical masks, in the community setting has not been well evaluated. There is no current evidence to make a recommendation for or against their use in this setting.

WHO is collaborating with research and development partners to better understand the effectiveness and efficiency of nonmedical masks. WHO is also strongly encouraging countries that issue recommendations for the use of masks in healthy people in the community to conduct research on this critical topic. WHO will update its guidance when new evidence becomes available. Advice on the use of masks in the context of COVID-19: interim guidance -3- In the interim, decision makers may be moving ahead with advising the use of nonmedical masks.

Where this is the case, the following features related to nonmedical masks should be taken into consideration:
• Numbers of layers of fabric/tissue
• Breathability of material used
• Water repellence/hydrophobic qualities
• Shape of mask
• Fit of mask

**Home care**

**Persons with suspected COVID-19 or mild symptoms should:**
• Self-isolate if isolation in a medical facility is not indicated or not possible
• Perform hand hygiene frequently, using an alcohol-based hand rub if hands are not visibly dirty or soap and water when hands are visibly dirty;
• Keep a distance of at least 1 m from other people;
• Wear a medical mask as much as possible; the mask should be changed at least once daily. Persons who cannot tolerate a medical mask should rigorously apply respiratory hygiene (i.e. cover mouth and nose with a disposable paper tissue when coughing or sneezing and dispose of it immediately after use or use a bent elbow procedure and then perform hand hygiene.)
• Avoid contaminating surfaces with saliva, phlegm, or respiratory secretions.
• Improve airflow and ventilation in their living space by opening windows and doors as much as possible.

**Caregivers or those sharing living space with persons suspected of COVID-19 or with mild symptoms should:**

30
• Perform hand hygiene frequently, using an alcohol-based hand rub if hands are not visibly dirty or soap and water when hands are visibly dirty;
• Keep a distance of at least 1 meter from the affected person when possible;
• Wear a medical mask when in the same room as the affected person;
• Dispose of any material contaminated with respiratory secretions (disposable tissues) immediately after use and then perform hand hygiene.
• Improve airflow and ventilation in the living space by opening windows as much as possible.

Healthcare settings
Symptomatic people visiting a health care setting should:
• Wear a medical mask while waiting in triage or other areas and during transportation within the facility;
• Not wear a medical mask when isolated in a single room, but cover their mouth and nose when coughing or sneezing with disposable paper tissues. Tissues must be disposed of appropriately, and hand hygiene should be performed immediately afterwards.

Health care workers should:
• Wear a medical mask when entering a room where patients with suspected or confirmed COVID-19 are admitted.
• Use a particulate respirator at least as protective as a US National Institute for Occupational Safety and Health certified N95, European Union standard FFP2, or equivalent, when performing or working in settings where aerosol-generating procedures, such as tracheal intubation, non-invasive ventilation, tracheotomy, cardiopulmonary resuscitation, manual ventilation before intubation, and bronchoscopy are performed.
• Full infection prevention and control guidance for health care workers is provided here

Mask management
For any type of mask, appropriate use and disposal are essential to ensure that they are effective and to avoid any increase in transmission. The following information on the correct use of masks is derived from practices in health care settings.
• Place the mask carefully, ensuring it covers the mouth and nose, and tie it securely to minimize any gaps between the face and the mask.
• Avoid touching the mask while wearing it.
• Remove the mask using the appropriate technique: do not touch the front of the mask but untie it from behind.
• After removal or whenever a used mask is inadvertently touched, clean hands using an alcohol-based hand rub or soap and water if hands are visibly dirty.
• Replace masks as soon as they become damp with a new clean, dry mask.
• Do not re-use single-use masks.
• Discard single-use masks after each use and dispose of them immediately upon removal.
